Office Action Summary

Application No.

09/560,373

Applicant(s)

MEREDITH ET AL. m

Examiner

Eric B. Kiss

Art Unit

2122

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 08 April 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-28 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-28 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 21 May 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). _____
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____ 6) ☐ Other: _____

DETAILED ACTION

1. The amendment of April 8, 2003, has been received and entered. Claims 1-28 are pending.

Drawings

2. The corrected or substitute drawings were received on May 21, 2003. These drawings are acceptable.

Response to Amendment

3. Applicant's submission of substitute Figure 2b appropriately addresses the objection to the drawings as detailed in the previous office action. Accordingly, this objection is withdrawn in view of Applicant's submission.
4. Applicant's amendment to the specification appropriately addresses the objection to the specification as detailed in the previous office action. Accordingly, this objection is withdrawn in view of Applicant's amendment.

Art Unit: 2122

5. Applicant's amendments to the claims appropriately address the objections to the claims as detailed in the previous office action. Accordingly, these objections are withdrawn in view of Applicant's amendments.

6. Applicant's amendments to the claims appropriately address the rejections of claims 21, 23, 26, and 27 under 35 U.S.C. §112, second paragraph, based on indefiniteness. Accordingly, these rejections are withdrawn in view of Applicant's amendments.

7. Applicant's amendments to claims 7, 12, 22, and 24 appropriately address the rejections of claims 7-22 and 24-28 under 35 U.S.C. §101, based on non-statutory subject matter. Accordingly, these rejections are withdrawn in view of Applicant's amendments.

Response to Arguments

8. Applicant's statement on page 12, paragraph 3, that "sufficient detail is provided to in order for one of ordinary skill in the art to perform the invention without undue experimentation" is not accompanied by an affidavit or declaration or other presentation of evidence necessary to support such a statement and appropriately respond to the issues raised by the Examiner. Therefore, Applicant's remarks are not persuasive and are considered ineffective to overcome the rejection of claims 1-6 under 35 U.S.C. §112, first paragraph, based on enablement.

Art Unit: 2122

9. In response to Applicant's statements traversing the rejection of claims 1-6 and 23 under 35 U.S.C. §101, based on non-statutory subject matter, the Examiner asserts that claims 1-6 and 23 describe a process that consists solely of the manipulation of an abstract idea; no useful, concrete, and tangible result is achieved by the claimed process. For example, claim 23 merely provides for distinguishing between two types of operations, expressing synchronization constraints and associating two types of operations. As a result of these steps, the operations have not necessarily been executed, nor have they necessarily been modified in a concrete, tangible way.

10. Applicant's arguments with regard to the newly claimed limitations of using a process algebra in claims 7, 12, 22-24, and 28, are addressed as set forth below.

Claim Rejections - 35 USC § 112

11. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

12. Claims 1-6 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Claimed method steps of using a first and second verb of a process algebra to represent and differentiate independent and interdependent operations (claim 1, lines 3-7) apparently refer

Art Unit: 2122

to page 14, third paragraph, of the specification. This portion of the specification describes the process algebra of the present invention as a variation of a prior art “conventional” PI calculus, which, as specified, is based on a single verb. The modification is described as “[allowing] for explicitly representing parallelism within the business workflow process by separating communicating concurrent transactions from independent concurrent transactions and mitigating deadlock associated with conventional systems”. However, the specification lacks disclosure of how the “verbs” are related to the indicated figure (Fig. 1d) and a mode for carrying out the modification of the prior art process algebra. The specification further does not explicitly state the particular roles of each individual variable in representing parallelism or mitigating deadlock within a system. As related to the claimed limitations, the specification does not clearly relate the concept of process algebra to that of business workflow and does not adequately describe how the verbs are used to differentiate an independent operation from a set of interdependent operations. Because the specification does not adequately describe the claimed subject matter, it would not enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Claim Rejections - 35 USC § 101

13. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Art Unit: 2122

14. Claims 1-6 and 23 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

As per claims 1-6 and 23, these claims are directed toward the manipulation of abstract data, i.e. process algebra verbs and business process operations. A process that consists solely of the manipulation of an abstract idea is not concrete or tangible. See *In re Warmerdam*, 33 F.3d 1354, 1360, 31 USPQ2d 1754, 1759 (Fed. Cir. 1994). See also *Schrader*, 22 F.3d at 295, 30 USPQ2d at 1459. The claimed invention as a whole must accomplish a practical application. That is, it must produce a "useful, concrete and tangible result." *State Street*, 149 F.3d at 1373, 47 USPQ2d at 1601-02. The purpose of this requirement is to limit patent protection to inventions that possess a certain level of "real world" value, as opposed to subject matter that represents nothing more than an idea or concept, or is simply a starting point for future investigation or research (*Brenner v. Manson*, 383 U.S. 519, 528-36, 148 USPQ 689, 693-96); *In re Ziegler*, 992, F.2d 1197, 1200-03, 26 USPQ2d 1600, 1603-06 (Fed. Cir. 1993)).

Claim Rejections - 35 USC § 102 and/or 35 USC § 103

15. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

16. Claims 7-14, 22-25, and 28 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Release 8.0 of the Workflow Template

Art Unit: 2122

software product publicly available from Template Software, Inc. in 1998 as evidenced by "Using the WFT Development Environment", 1998 (hereinafter Template).

As per claim 7, Template discloses a user interface component (Workflow Design Editor) and a plurality of model components (tasks, flows, work items, roles, junctions, and labels) accessible through the user interface component and adapted to allow a user to create a model of a business process (workflow design; see "Introduction" on page 3-2, and in particular, the first paragraph of that section), the plurality of model components comprising a distinguishing model component (copy flow junction box; see "Creating copy flows" on page 3-20) for distinguishing between concurrent autonomous (using separate flows) business operations and concurrent interdependent (using a single flow) business operations (the copy flow allows operations using the same flow to be represented independently; see Fig. 3-3 on page 3-12 in which the copy flow junction box supplies the same "REQUISITION" flow to both the "Approve Requisition" and "Check Inventory" tasks). It is unclear from the disclosure of Template whether a process algebra is used to implement the model described. However, as admitted by Applicant, "it is well known in the art that PI-calculus can be utilized to model processes" (see page 12, paragraph 3 of the amendment mailed April 8, 2003). Therefore, if not already inherently included, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to modify the product described in Template to include the use of a process algebra. One would be motivated to do so implement process modeling using well-established and widely supported means.

As per claim 8, Template further discloses a transaction grouping model component (compound flow junction box) for grouping business operations into concurrent interdependent

Art Unit: 2122

transactions (forms a work item set associated with the compound flow; see “Creating compound flows” on page 3-19).

As per claim 9, Template further discloses the grouping model component (compound flow junction box) providing synchronization of concurrent interdependent transactions based on the completion of the concurrent interdependent transactions (forming a concatenation of the two or more input work items, as a result of an *And* junction condition; see “Creating compound flows” on page 3-19).

As per claims 10 and 11, Template further discloses associating actions (tasks) with transactions (work items; see Table 3-1 on page 3-3 and second paragraph of “About the Task Editor perspective on tasks” on page 6-2). Therefore, the transaction grouping model component disclosed by Template also functions as an action grouping model as claimed.

As per claim 12, Template discloses a user interface component (Workflow Design Editor) and a plurality of model components (tasks, flows, work items, roles, junctions, and labels) accessible through the user interface component and adapted to allow a user to create a model of a business process (workflow design; see “Introduction” on page 3-2, and in particular, the first paragraph of that section), the plurality of model components comprising at least one boundary establishing component (flows) for defining transaction (work item) boundaries (a flow defines a possible route between tasks through which a work item can travel; see Table 3-1 on page 3-3). It is unclear from the disclosure of Template whether a process algebra is used to implement the model described. However, as admitted by Applicant, “it is well known in the art that PI-calculus can be utilized to model processes” (see page 12, paragraph 3 of the amendment mailed April 8, 2003). Therefore, if not already inherently included, it would have been obvious

Art Unit: 2122

to one having ordinary skill in the computer art at the time the invention was made to modify the product described in Template to include the use of a process algebra. One would be motivated to do so implement process modeling using well-established and widely supported means.

As per claim 13, Template further discloses a component for establishing concurrent operations (copy flow; see Table 3-1 on page 3-3 and "Creating copy flows" on page 3-20).

As per claim 14, Template further discloses a component for establishing sequential operations (plain flow; see Table 3-1 on page 3-3).

As per claim 22, Template discloses a user interface component (Workflow Design Editor) and a plurality of model components (tasks, flows, work items, roles, junctions, and labels) accessible through the user interface component and adapted to allow a user to create a model of a business process (workflow design; see "Introduction" on page 3-2, and in particular, the first paragraph of that section), the plurality of model components comprising a component (compound flow junction box) for defining concurrent synchronizing constraints as occurring upon the completion of the autonomous operations (forming a concatenation of the two or more input work items, as a result of an *And* junction condition; see "Creating compound flows" on page 3-19). It is unclear from the disclosure of Template whether a process algebra is used to implement the model described. However, as admitted by Applicant, "it is well known in the art that PI-calculus can be utilized to model processes" (see page 12, paragraph 3 of the amendment mailed April 8, 2003). Therefore, if not already inherently included, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to modify the product described in Template to include the use of a process algebra. One would be motivated to do so implement process modeling using well-established and widely supported means.

Art Unit: 2122

As per claims 23, 24, and 28, Template discloses a method of, software for (Workflow Template 8.0), and means for: distinguishing between synchronization of autonomous concurrent operations (using separate flows) and interdependent concurrent operations (using a single flow; the copy flow allows operations using the same flow to be represented independently; see Fig. 3-3 on page 3-12 in which the copy flow junction box supplies the same "REQUISITION" flow to both the "Approve Requisition" and "Check Inventory" tasks); expressing synchronization constraints on completion of autonomous concurrent operations (forming a concatenation of the two or more input work items, as a result of an *And* junction condition; see "Creating compound flows" on page 3-19); and associating transaction operations and groups of business operations (creating a workflow design that represents the flow of work throughout your business; see "Introduction" on page 2-2). It is unclear from the disclosure of Template whether a process algebra is used to implement the model described. However, as admitted by Applicant, "it is well known in the art that PI-calculus can be utilized to model processes" (see page 12, paragraph 3 of the amendment mailed April 8, 2003). Therefore, if not already inherently included, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to modify the product described in Template to include the use of a process algebra. One would be motivated to do so implement process modeling using well-established and widely supported means.

As per claim 25, Template further discloses a graphical user interface (Workflow Design Editor; see "Introduction" on page 3-2, and in particular, the first paragraph of that section) adapted to allow a user to model a business process using the components.

Claim Rejections - 35 USC § 103

17. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

18. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Template as applied to claim 13 above.

Official notice is taken that it was well known and commonly practiced in the computer art at the time the invention was made to incorporate a computer readable medium into a computer system in order to allow data transfer between the medium and the system, such as, for example, for the execution of a program embodied in a CD-ROM medium on such a computer system. Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to have a computer readable medium residing on a computer system as part of a system incorporating the Template product.

19. Claims 15-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Template as applied to claim 12 above, and further in view of U.S. Patent No. 5,940,839 to Chen et al.

As per claim 15, Template discloses such a system for business process modeling including a user interface and a plurality of model components (see disclosure applied above to claim 12) but fails to teach a compensation model component adapted to compensate committed interdependent concurrent transactions and being invoked upon the occurrence of a failed interdependent concurrent transaction. However, Chen teaches, as part of a transaction

Art Unit: 2122

processing method and system, such a compensation model component (transaction management system (TMS) mechanisms; see column 5, lines 10-48) adapted to compensate committed interdependent concurrent transactions and being invoked upon the occurrence of a failed interdependent concurrent transaction (see column 2, line 65 through column 3, line 33). Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to modify the Template product to incorporate a compensation model component as once taught by Chen. One would be motivated to do so to provide the ability to handle transaction failures.

As per claim 16, Chen further teaches transactions being children in a parent transaction (as part of an "ancestor tree"; see column 3, lines 24-27) wherein a compensation routine is invoked by the parent transaction (the failed transaction is undone by proceeding from the in-process closest recoverable ancestor (ICRA) transaction; see column 3, lines 11-33). Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to further modify the Template product to include invocation of a compensation model component by a parent transaction as per the teachings of Chen. One would be motivated to do so allow recovery of a failed transaction by reverting back to a parent transaction.

As per claim 17, Chen further teaches calling compensation routines within the committed interdependent concurrent transactions (see column 9, lines 4-17). Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to further modify the Template product to include compensation routines

Art Unit: 2122

within committed interdependent transactions as per the teachings of Chen. One would be motivated to do so enable elimination of the effect of a transaction.

As per claims 18-20, Chen further teaches calling compensation routines within a failed transaction based on information on committed transactions stored within a database (see column 8, line 61 through column 9, line 5). Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to further modify the Template product to include the compensation model component calling compensation routines within the failed interdependent concurrent transaction based on information on the committed interdependent concurrent transactions stored within a database as per the teachings of Chen. One would be motivated to do so allow for compensation of committed transactions beyond the failure affected scope.

20. Claims 26 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Template as applied to claim 24 above, and further in view of U.S. Patent No. 6,393,456 to Ambler et al.

As per claims 26 and 27, Template discloses such software, including the first, second, and third components performing functions in a schedule (see disclosures applied above to claim 24), but does not explicitly disclose the software comprising a programmable language having an XML syntax. However, Ambler teaches that workflow specifications may be written in such a programmable language having an XML syntax (see column 8, lines 42-46 and column 12, lines 49-59). Therefore, it would have been obvious to one having ordinary skill in the computer art at the time the invention was made to modify the Template product to include a programmable

Art Unit: 2122

language having an XML syntax as once taught by Ambler. One would be motivated to do so to provide a robust tool for specifying workflows.

Conclusion

21. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

22. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Eric B. Kiss whose telephone number is (703) 305-7737. The examiner can normally be reached on Tue. - Fri., 7:30 am - 5:00 pm. The examiner can also be reached on alternate Mondays.

Art Unit: 2122

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gregory Morse can be reached on (703) 308-4789.

Any response to this action should be mailed to:

Commissioner for Patents
P.O.Box 1450
Alexandria, VA 22313-1450

Or faxed to:

(703) 746-7239 (for formal communications intended for entry)

Or:

(703) 746-7240 (for informal or draft communications, please label "PROPOSED" or "DRAFT")

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, 22202, Fourth Floor (Receptionist).

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.
